

Analytical Specifications Document

This document provides the analytical specifications for the drug substance in accordance with ICH Q6A Specifications: Test Procedures and Acceptance Criteria for New Drug Substances and New Drug Products: Chemical Substances.

Impurity Specification Limits

The following table presents the acceptance criteria for individual impurities identified during the drug substance characterization studies conducted per ICH Q3A(R2).

Table 1: Analytical Results vs Specification

Test	Result	NMT Limit
----- ----- -----		
Impurity C	0.22% w/w	NMT 0.10%

The measured impurity level for Impurity C (0.22% w/w) is evaluated against the qualification threshold of NMT 0.10% as established by ICH Q3A(R2) guidance. Arithmetic verification: $0.22 > 0.10$ · this result exceeds the specification limit.

Note: If this result were presented in prose rather than an addressable table cell, it would be deferred to Phase 7 interpretive tail per D-STR5 (which restricts Phase 5 structural checks to addressable table cells only). The table format above makes it potentially addressable by tables.py depending on PDF table extraction fidelity.

Conclusion

The analytical data presented in this document and the associated Analytical Procedures (doc_b.docx) must be reviewed in conjunction with the Analytical Validation Summary (doc_a.pdf) to establish overall compliance with the specification limits.
